

Glosario de términos

- **Hg0** – irradiación global horizontal
 - **Hbn** – irradiación directa normal
 - **Hdif** – irradiación difusa
 - **H0** – irradiación extraterrestre
 - **Ig0** – irradiaciencia global horizontal
 - **Ign** – irradiancia directa normal
 - **Idif** – irradiancia difusa
 - **I0** – irradiancia extraterrestre
-
- **ASR** – Año solar representativo
 - **VMR** – Valor mensual representativo
 - **Kts** – Distinción diaria según el grado de nubosidad mediante K_t . En el numerador se colocan valores procedentes de estimaciones a partir de imágenes de satélite.
 - **Ktc** - Distinción diaria según el grado de nubosidad mediante K_t . En el numerador se colocan valores procedentes de la campaña de medidas.
 - **No Kt** – No distinción diaria según el grado de nubosidad.

A.I Tablas de comprobación de días descartados

La equivalencia de colores de la tabla es la siguiente

- Verde ----> Día válido.
- Rojo ----> Día descartado por tener un hueco mayor de una hora.
- Gris ----> Día descartado por ausencia de datos.
- Amarillo ----> Día descartado por parada del seguidor.

Tabla A I.3: Días descartados. Periodo entre agosto 2010 y julio 2011

A.II Clasificación de los días según el grado de nubosidad

Al ver los resultados de la corrección sin planteamiento de distinción de días tan poco exactos existe la necesidad de plantear algún tipo de alternativa. El grado de nubosidad es un factor que afecta de forma determinante a la radiación solar. De hecho los modelos utilizados a la hora de estimar tratan de realizar distinciones en función de la nubosidad para calcular la radiación, pues los patrones observados son diferentes en días totalmente nublados o días claros. Se describen aquí brevemente los métodos de clasificación principales, justificándose el uso de la opción seleccionada. Esta información ha sido obtenida de la bibliografía existente.

1. Número de horas de sol

Este método se basa en la medida de la heliofanía mediante un heliógrafo de Campbell-Stokes. El dispositivo consiste en una esfera pulida de cristal que permite pasar los rayos precedentes del Sol. Cuando la radiación que atraviesa la esfera excede un determinado valor umbral, se quema una banda de cartulina localizada debajo de ésta, quedando marcado el número de horas en que la radiación solar ha excedido dicho umbral. El número de horas obtenido en la banda permite identificar de qué tipo de día se trata.

No se dispone de datos de heliofanía en el caso a estudio por lo que este método no podrá ser aplicado.

Figura A II.1: Heliógrafo de Campbell-Stokes

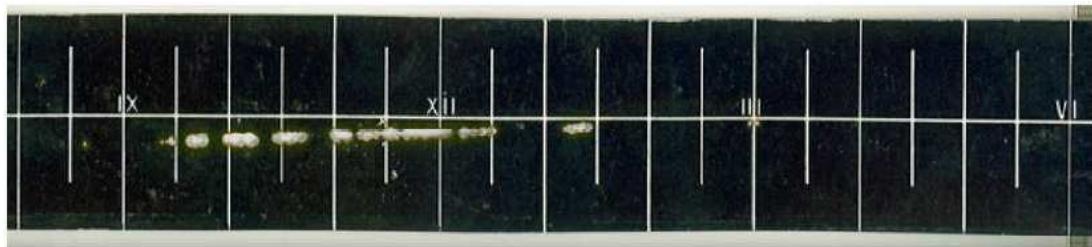

Figura A II.2: Banda de cartulina del heliógrafo

ANEXOS

2. Distribución de cielo cubierto, CLD

La base de este método es la medida visual de la cantidad de nubes que cubren el cielo en un instante determinado. No requiere ningún elemento de medida, únicamente es necesario un observador experimentado en el método CLD para determinar la clasificación del día. El índice CLD se mide en Oktas y refleja los octavos del cielo cubierto por nubes. A continuación se añade el criterio de clasificación seguido por la Organización Meteorológica Mundial.

| Oktas | Definition | Category |
|-------|--|---------------|
| 0 | Sky clear | Fine |
| 1 | 1/8 of sky covered or less, but not zero | Fine |
| 2 | 2/8 of sky covered | Fine |
| 3 | 3/8 of sky covered | Partly Cloudy |
| 4 | 4/8 of sky covered | Partly Cloudy |
| 5 | 5/8 of sky covered | Partly Cloudy |
| 6 | 6/8 of sky covered | Cloudy |
| 7 | 7/8 of sky covered or more, but not 8/8 | Cloudy |
| 8 | 8/8 of sky completely covered, no breaks | Overcast |

Figura A II.3: Clasificación CLD según la WMO

El mayor problema de este método radica en el elevado grado de subjetividad existente por parte del observador, por lo tanto no resulta recomendable aplicarlo.

3. Análisis fractal de datos de irradiancia

El método de clasificación de días solares aplicando el análisis fractal de datos de irradiancia se basa en el algoritmo de Minkowski-Bouligand y pretende cuantificar las fluctuaciones aleatorias que se producen en la curva de irradiancia-tiempo como consecuencia de la nubosidad. Por tanto, lo que se obtiene es una variable denominada dimensión fractal que indica la irregularidad objeto de análisis. Los fractales permiten modelar las formas de cualquier fenómeno natural y es por ello que resulta muy útil para cuantificar las irregularidades que se producen en la curva de irradiancia considerada.

Los resultados que a continuación se añaden se obtuvieron tras un profundo análisis al aplicar el método de análisis fractal a tres días diferentes, clasificados a priori como día despejado, de nubes y claros y cubierto, se obtienen los resultados de la figura A II.4.

ANEXOS

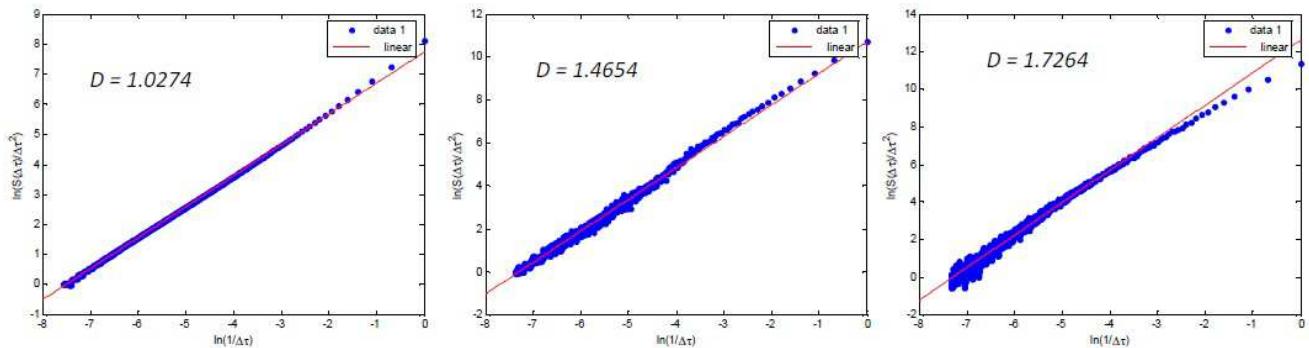

Figura A II.4: Ajuste por mínimos cuadrados de los puntos obtenidos y dimensión fractal de sus rectas para: (a) días despejado. (b) días de nubes y claros. (c) día cubierto

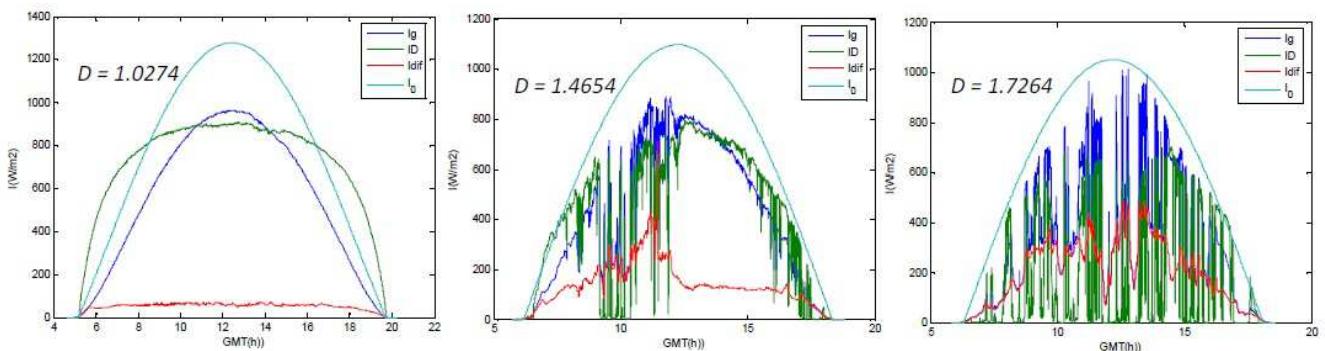

Figura A II.5: Curvas de irradiancia y dimensión fractal correspondientes a: (a) día despejado. (b) día de nubes. (c) día cubierto

Tras analizar el conjunto de gráficas anteriores se obtiene cierta información. Se puede ver que la variable dimensión fractal adquiere valores dentro del intervalo 1 a 2. Cuando esta toma valor unidad se trata de un día absolutamente despejado, mientras que el otro extremo se corresponde con días de elevadas fluctuaciones, es decir, días cubiertos.

A pesar de que después de analizar estas gráficas parece que la dimensión fractal puede ser un buen método para clasificar los días según la nubosidad, presenta dos problemas.

- Se analiza un día tan cubierto que las oscilaciones en la curva de irradiancia no son tan grandes como para clasificarlo correctamente, de forma que la dimensión fractal obtenida se encuentra en la zona de día nublado.

- Se analiza un día en el que la primera parte de éste está totalmente despejada y la segunda totalmente cubierta, de forma que su dimensión fractal haga que se clasifique como un día nublado.

4. Índices de claridad del cielo

Para la aplicación de este método se utilizan los siguientes índices de claridad.

ANEXOS

$$K_t (h) = \frac{I_g (h)}{I_0 (h)} = \text{Relación entre las irradiancias global y extraterrestre}$$

$$K_{d0} (h) = \frac{I_{dif} (h)}{I_0 (h)} = \text{Relación entre las irradiancias difusa y extraterrestre}$$

$$K_d (h) = \frac{I_{dif} (h)}{I_g (h)} = \text{Relación entre irradiancias difusa y global}$$

Para la clasificación de días en función del grado de nubosidad se emplean las correlaciones entre K_{d0} - K_t y K_d - K_t .

La representación conjunta de K_{d0} - K_t , para un lugar determinado, se puede ver en la Figura 4.16.

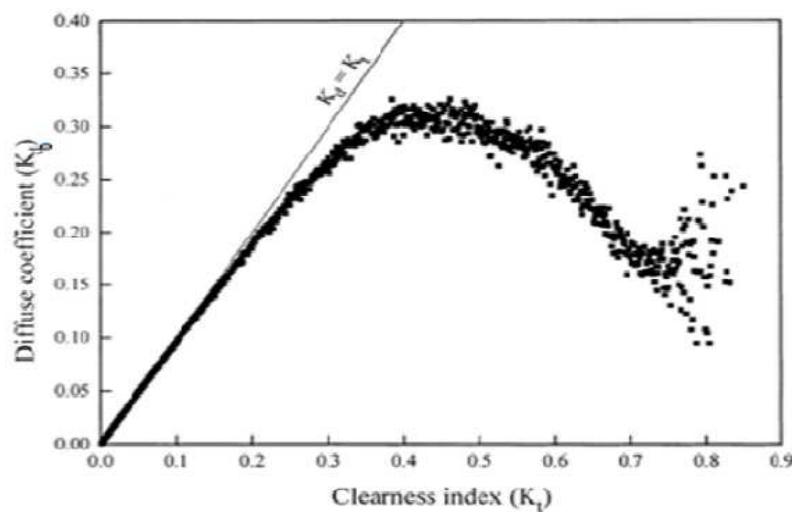

Figura A II.6: Correlación K_{d0} - K_t horario

Si se analiza esta gráfica se puede comprobar que el índice de claridad varía prácticamente de forma lineal, con pendiente unidad, con el índice de difusa hasta un valor próximo a 0,15. Esto indica que bajo un cielo completamente cubierto la componente directa tiene un valor muy próximo a cero y además se observa que la dispersión de puntos en este caso es inexistente. Para valores del índice de claridad mayores de 0,15 la relación empieza a alejarse del comportamiento lineal y los puntos obtenidos se encuentran más dispersos debido a la variedad de estados de cielos nublados que se pueden dar. Para un índice de claridad mayor de 0,7 el grado de dispersión es importante.

De igual modo se puede analizar la correlación K_d - K_t .

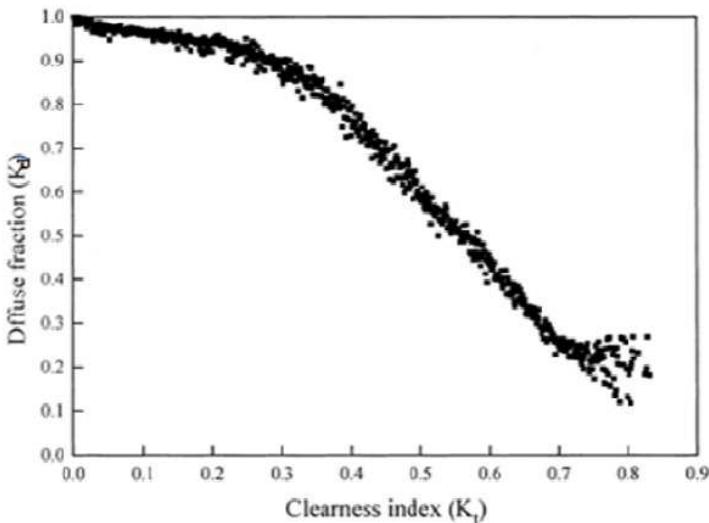

Figura A II.7: Correlación Kd-Kt horario

En esta gráfica se puede observar como el valor de la fracción difusa, k_d , es prácticamente igual a 1 en el primer tramo donde el índice de claridad es pequeño, $k_t < 0,15$. La dispersión de puntos es prácticamente inexistente. Esto se puede entender de nuevo como que el cielo está bastante cubierto de nubes y la irradiación global coincide prácticamente con la difusa. En el intervalo de K_t comprendido entre 0,15 y 0,7 el grado de dispersión aumenta. La fracción difusa va disminuyendo al aumentar el índice de claridad, lo cual indica que la componente directa de la radiación se vuelve dominante frente a la difusa a medida que el cielo se encuentra más despejado. Ya que la dispersión de K_d y K_{d0} se incrementa para un K_t mayor de 0,7, esto indica una combinación de día claro y parcialmente nublado más que un día totalmente claro. Se obtendría un valor de K_d del orden de 0,08 para un cielo totalmente despejado y aproximadamente 0,27 para un cielo de nubes y claros.

El siguiente paso es determinar qué índice permite clasificar el día según las condiciones de nubosidad. En este sentido se tiene que el índice de claridad para valores grandes puede conducir a una clasificación errónea por el hecho de que valores mayores a 0,7 pueden dar condiciones de cielo despejado o nubes y claros. Además no existe un valor fijo de K_t para el que se pueda afirmar que se tiene un cielo despejado. Sin embargo el índice de claridad es la variable más ampliamente utilizada por investigadores para clasificar días en despejados, nublados y cubiertos. Podrían haberse utilizado como índices de clasificación el k_d o el k_{d0} pero presentan inconvenientes considerables. En el caso del primero para valores cercanos a 1 se tiene un cielo totalmente cubierto mientras que valores próximos a cero se consideran cielos despejados. El problema de utilizar este índice radica en que se necesita medir dos variables para poder conocerlo en lugar de una que necesitan los otros dos, por lo que el error cometido al medir dos variables puede ser mayor además de los complejos que resulta medir la irradiación difusa si se compara con la medición de la global. En el caso de utilizar como variable de decisión el índice k_{d0} se tiene la ventaja de que sólo hay que medir una sola variable que correspondería a la irradiancia difusa, y cuyos inconvenientes ya se han mencionado. Todo esto hace que el método de clasificación mediante el índice K_t sea el más extendido a la hora de clasificar los días mediante índices de claridad del cielo. El criterio seguido entonces es:

$$K_t \leq 0,3 \rightarrow \text{Cielo cubierto}$$

$$0,3 \leq K_t < 0,65 \rightarrow \text{Cielo cubierto}$$

$$K_t \geq 0,65 \rightarrow \text{Cielo despejado}$$

ANEXOS

Téngase en cuenta que este modo de clasificación es muy sencillo y no incrementa nada la dificultad de la clasificación diaria.
